I compared my pages in three browsers: Google Chrome, Firefox, and Safari. I developed the page in Chrome, so everything looked as I expected in Chrome. The fonts, colors, links, and form elements all looked correct, with the colors and padding applied to the form elements and the links correctly. In Firefox, the colors and fonts looked the same. I expected this because the fonts came from Google Fonts or were web-safe fonts. However, the form elements looked different. Specifically, the radio buttons looked different. I used the "appearance: none" setting to remove the default appearance. I even added the "-webkit" and "-moz" prefixes, but Firefox and Safari both ignored the width value. Later, I changed the "display" property from "inline" to "inline-block," and the width was fixed. However, the alignment inside the fieldset was different.
